Product Maintenance ROTON Continuous Hinges

Hinges should be well greases and checked on a regular basis for lubrication. It is recommended that hinges in high used commercial, high frequency applications or those in extreme environmental conditions be lubricated annually to ensure quiet operation and a long life.

The occasional removal of airborne debris may be accomplished with a mild detergent. This will help maintain the appearance.

Occasionally remove airborne debris from the surface tracks. To remove dirt, simply wipe with a damp cloth.

Use of Loc-Tite on all screw threads is recommended for hinges on public buildings. Hinge screws should be periodically inspected for tightness in high traffic areas.

Abrasive cleaners or lacquer thinner should not be used to clean the surface of hinges. To do so will void any warranty for the product.
